

WSL setup to run MCP Servers locally

We need to install Linux Windows SubSystem (WSL) that allows you to run Linux OS on your PC and running Cursor/VSCode connected to that.

You have to be in Linux Home directory or in the Home directory of the PC. The stuff you want to work on should be in Linux Home directory.

Two ways to do it:

Type WSL or Ubuntu.

If you type Ubuntu, you go straight into Linux Home directory

Open Powershell

```
wsl --install -d Ubuntu
```

Create a default Unix user account: xxxxxxxxxx

Password: xxxxxxxxxxxxxxxxxxxxxx

```
wsl -d Ubuntu
```

```
cd ~
```

```
curl -LsSf https://astral.sh/uv/install.sh | sh
```

```
exit
```

```
wsl -d Ubuntu to return to Linux
```

```
cd ~
```

```
mkdir projects
```

```
cd projects
```

```
git clone <Your_Repo>
```

```
uv sync
```

```
wsl --list --verbose
```

from a new Terminal

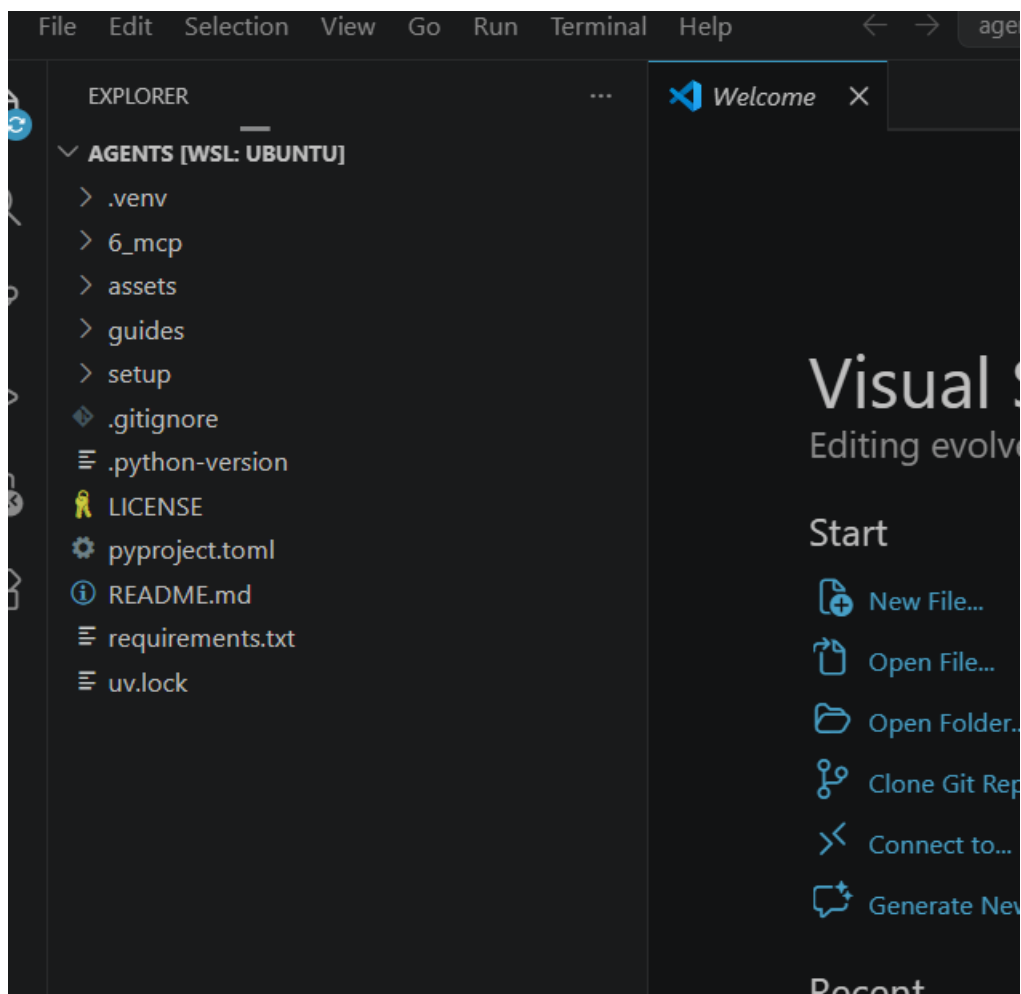

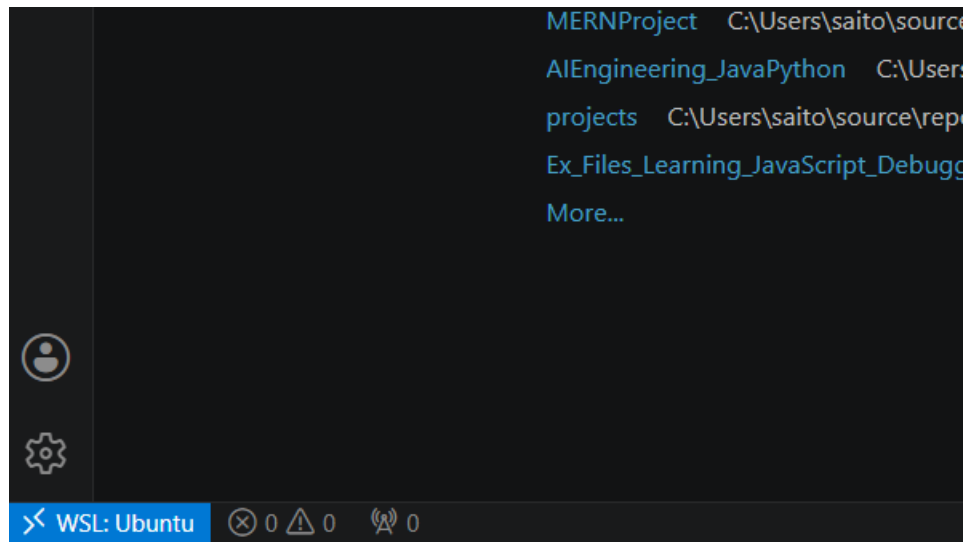

```
PS C:\Users\saito\source\repos\AIAgenticEngg> wsl --list --verbose
```

NAME	STATE	VERSION
* Ubuntu	Running	2

If you have more than one, you might need to do this to make sure that Ubuntu is your default one: wsl --setdefault Ubuntu

Open VSCode

Ctrl+Shift+P and search for Remote-WSL: New Window

it should show

saito@SaiNov23Comp:~/AIAGenticEngg/projects/agents\$ which node

which npx

/usr/bin/node

/usr/bin/npx
