

For Claude Desktop, use this exact approach.
Install Claude Desktop first

Open this config file in Windows:
C:\PATH\claude_desktop_config.json

Put this JSON in it (or merge into existing mcpServers object):

```
{
  "mcpServers": {
    "weather": {
      "command": "C:\PATH\.venv\Scripts\python.exe",
      "args": [
        "C:\PATH\mcp-server-weather\server.py"
      ]
    }
  }
}
```

Claude Desktop => File => Settings => Developer => Local MCP servers

```
{
  'latitude': 49.2498,
  'longitude': -133.2334
}
```

Those coordinates place you somewhere in the **Pacific Ocean**, roughly between Vancouver Island and the Hawaiian Islands — quite remote!

Were you perhaps trying to:

What would you like to do with these coordinates?

1 Get the weather there

2 Show it on a map

3 Something else

4 Something else

Close
